Performance testing

📊 Performance Testing

Enforcing Mandatory Fields Using UI Policies & Migrating Changes with Update Sets

---

🔷 1. Objective

- Ensure UI Policies and form validations perform efficiently
- Verify that mandatory field enforcement does not slow down the system
- Validate smooth migration using Update Sets

🔷 2. Key Performance Areas

⚡ Form Load Performance

- Measure time taken to load forms with UI Policies applied
- Ensure no delay due to multiple policies

✅ *Expected Result:* Form loads within acceptable time (e.g., < 2–3 seconds)

⚡ UI Policy Execution Time

- Check how quickly UI Policies trigger when fields change
- Validate real-time response

✅ *Expected Result:* Immediate execution without lag

⚡ **Form Submission Time**

- **Measure time taken to submit form after validation**
- **Ensure mandatory checks do not delay submission**

✅ ***Expected Result:*** **Submission completes quickly without errors**

⚡ **Concurrent Users Load**

- **Test system with multiple users filling forms simultaneously**

✅ ***Expected Result:*** **No performance degradation under load**

⚡ **Update Set Migration Performance**

- **Measure time taken to move Update Sets between instances**
- **Check for delays during preview and commit**

✅ ***Expected Result:*** **Smooth and timely migration**

🔷 **3. Test Scenarios**

Scenario ID	Scenario Description	Expected Outcome
PT-1	Load form with multiple UI Policies	No delay in form rendering

Scenario ID	Scenario Description	Expected Outcome
PT-2	Trigger UI Policy on field change	Instant response
PT-3	Submit form with all mandatory fields	Successful submission
PT-4	Submit form with missing fields	Immediate error message
PT-5	Multiple users accessing form	System remains stable
PT-6	Migrate Update Set	No errors, consistent transfer

🔷 4. Performance Metrics

- Response Time (Form Load & Submission)
- UI Policy Execution Time
- Throughput (requests per second)
- Error Rate
- System Resource Usage (CPU, Memory)

🔷 5. Tools (ServiceNow Context)

- ServiceNow Performance Analytics
- Browser Developer Tools (Network tab)
- Load testing tools (e.g., JMeter)

🔷 6. Expected Outcome

- Fast and responsive UI
- No lag in validation
- Stable performance under load
- Reliable Update Set migration

User acceptance testing

📊 User Acceptance Testing (UAT)

Enforcing Mandatory Fields Using UI Policies & Migrating Changes with Update Sets

---

🔷 1. Objective

- Ensure the solution meets business requirements
- Validate that mandatory fields are enforced correctly
- Confirm Update Sets migration works as expected
- Get final approval from business users before production

🔷 2. UAT Scope

- UI Policy behavior on forms
- Mandatory field validation
- Error messages & user guidance
- Form submission process
- Update Set migration (Dev → Test → Prod)

🔷 3. Test Scenarios

Test Case ID	Scenario	Steps	Expected Result	Status
UAT-1	Verify mandatory fields	Open form	Mandatory fields are clearly marked	Pending
UAT-2	Submit empty form	Leave required fields blank & submit	Error message displayed	Pending
UAT-3	Fill all required fields	Enter valid data	Form submits successfully	Pending
UAT-4	UI Policy trigger	Change field conditions	Fields become mandatory dynamically	Pending
UAT-5	Error message clarity	Trigger validation error	Clear and user-friendly message shown	Pending
UAT-6	Update Set creation	Make config changes	Changes captured in Update Set	Pending
UAT-7	Update Set migration	Move update set to next instance	Migration successful without errors	Pending
UAT-8	Update Set validation	Preview update set	No conflicts or issues	Pending

---

🔷 4. Acceptance Criteria

- All mandatory fields must be enforced correctly
- Users cannot submit incomplete forms
- UI Policies should work dynamically without errors
- Error messages should be clear and helpful
- Update Sets must migrate successfully across environments
- No defects in production deployment

🔷 5. User Roles Involved

- End Users → Validate form usability
- Business Analysts → Validate requirements
- Administrators → Validate migration via Update Sets

🔷 6. UAT Sign-off Criteria

- All test cases are passed
- No critical or high-priority defects
- Business stakeholders approve the solution
- System is ready for production deployment

✅ Final Outcome

- Improved user experience
- Accurate and complete data
